AI for Assessors

PRACTICE

FOUNDATIONAL

Use AI to widen your judgment, not replace it — and stay defensible.

THE PROBLEM

What you're facing

AI can triage parcels, surface anomalies, and draft narratives, but assessment is a defensible, statutory act — you can't certify a value you can't explain.

WHY IT MATTERS

What's at stake

Used well, AI removes the sorting and lets the assessor spend judgment where it matters. Used badly, it produces confident, unexplainable values that collapse at the BOE and erode public trust.

THE MENTAL MODEL

How experts think

Experts treat AI as a tireless analyst that proposes, while the human approves and the record proves. They demand that every AI-surfaced signal trace back to source data, and they never certify a number whose reasoning they couldn't defend to a taxpayer or a board.

Workflow

1. Let AI triage and rank where attention is needed (anomalies, gaps, drift).
2. Require every signal to cite its source data.
3. Apply professional judgment to the flagged set.
4. Keep the human as the approver of record; AI proposes, you commit.
5. Preserve the evidence chain for defensibility.

Common mistakes

- Certifying an AI value you can't explain.
- Trusting a signal with no traceable source.
- Automating the judgment instead of the sorting.
- Losing the evidence chain that makes the value defensible.

Tools

Anomaly/triage models Source-linked evidence Human-in-the-loop review queue Audit/trace log

DO THIS NEXT

Now What?

- 1 Point AI at triage and anomaly detection first — the highest-leverage, lowest-risk use.
- 2 Insist on source-linked evidence for every signal you act on.
- 3 Keep yourself as the approver of record; never certify the unexplainable.
