

Import MLS

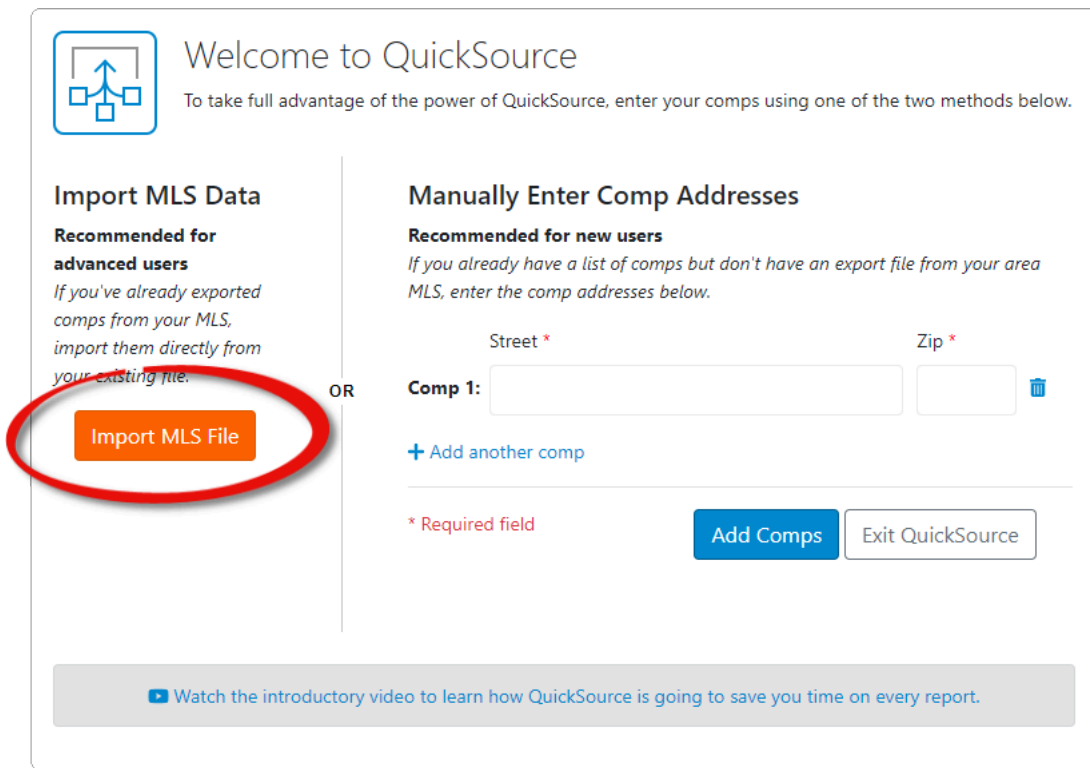

To import MLS property data into QuickSource, the first thing you need to do is set up an export template on your MLS website. This is a one-time process — once you create your template, all you need to do is simply choose your custom template from a list, export your data and save it to a convenient location on your computer, and import it into your a la mode software. [Click here](#) for step-by-step instructions on how to export data from your MLS for use with QuickSource.

Once you've exported data from your MLS, follow the instructions below to import the file in QuickSource:

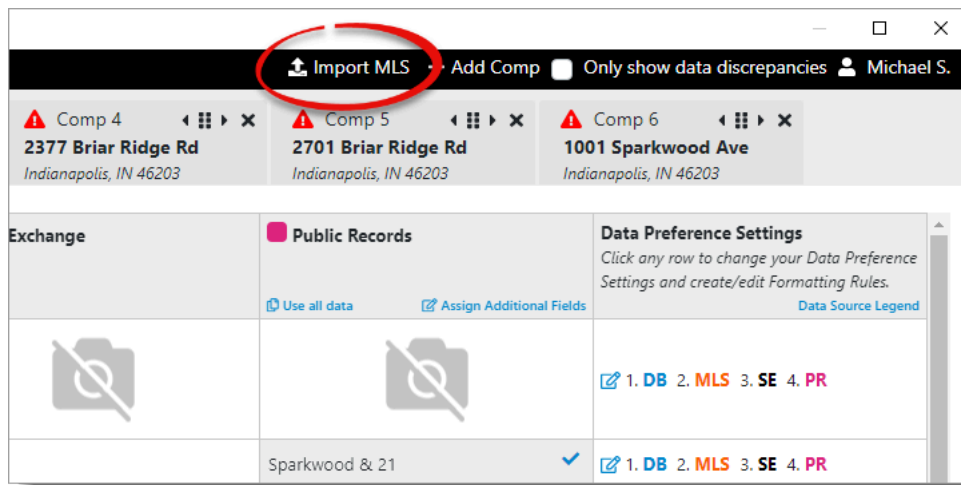

1. From the [Side-by-Side PowerView](#) in your report, click [QuickSource](#) in the toolbar on the upper left.

2. When the QuickSource window appears:
 - If you haven't added comparables to your report, you're prompted to import an MLS file, or [add comps manually](#). Click **Import MLS File**.

- If you've added comps to your report, but want to import additional comps from your MLS, click **Import MLS** on the upper right.

3. When the MLS import screen appears, select your **State** and **Search for your MLS** board using the drop-down menus. Then, click **Next**.

QUICKSOURCE.

4. Review the list of field names and/or recommended steps for creating a custom export template on your MLS website to ensure your file will import successfully. Then, click **Next**.

If QuickSource indicates that your MLS hasn't been mapped yet, and you're comfortable [creating a field map](#), review the list of required fields and click **Continue, I'll map it myself**.

5. Drag and drop the file you exported from your MLS into the import window, or click **Browse** to manually locate and open your export file. Once the file is uploaded, the preview pane on the right displays an alert if any required fields or recommended fields are missing.

Click **Customize** on the lower right to select and use a different field map for your MLS, or to customize and create your own field map. [Click here](#) for more information.

6. When you're ready to import and transfer your MLS data into QuickSource, click **Finish**.

That's it! When you're returned to the [QuickSource](#) Data Discrepancy view, review the data and discrepancies from your available data sources, choose the fields you want to use, and transfer the data to your report.
